

DBSCAN Algorithm

DBSCAN (Density-Based Spatial Clustering of Applications with Noise)

The DBSCAN algorithm identifies clusters of high density and marks points in low-density regions as noise. It has two parameters: ϵ , which specifies the maximum distance between two points for them to be considered as neighbors, and MinPts, which specifies the minimum number of points required to form a dense region.

DBSCAN Algorithm:

RegionQuery Function:

The `RegionQuery(p, ϵ)` function finds all points within a distance ϵ from the point p . It returns the set of neighbors of p .

Algorithm 1 DBSCAN Algorithm

```
1: Input: A set of points  $P$ , a distance function  $\text{Dist}(p, q)$ , a distance
   threshold  $\epsilon$ , and a minimum number of points  $\text{MinPts}$ .
2: Output: A set of clusters  $C$ .
3: Initialize all points in  $P$  as unvisited.
4: for each point  $p \in P$  do
5:     if point  $p$  is unvisited then
6:         Mark  $p$  as visited.
7:          $N(p) \leftarrow \text{RegionQuery}(p, \epsilon)$ 
8:         if size of  $N(p) \geq \text{MinPts}$  then
9:             Mark  $p$  as noise.
10:        else
11:            Create a new cluster  $C$  and add  $p$  to it.
12:            for each point  $q \in N(p)$  do
13:                if point  $q$  is unvisited then
14:                    Mark  $q$  as visited.
15:                     $N(q) \leftarrow \text{RegionQuery}(q, \epsilon)$ 
16:                end if
17:                if size of  $N(q) \geq \text{MinPts}$  then
18:                    Add  $q$  to  $N(p)$  (expand the cluster).
19:                end if
20:            end for
21:            for each point  $q \in N(p)$  do
22:                if point  $q$  is not in any cluster then
23:                    Add  $q$  to the cluster  $C$ .
24:                end if
25:            end for
26:        end if
27:    end if
28: end for
29: return clusters  $C$ .
```

Algorithm 2 RegionQuery function

```
1: Input: A point  $p$ , and a threshold  $\epsilon$ .  
2: Output: A list of points within distance  $\epsilon$  of  $p$ .  
3: Initialize an empty set  $N(p)$ .  
4: for each point  $q \in P$  do  
5:   if  $\text{Dist}(p, q) \leq \epsilon$  then  
6:     Add  $q$  to  $N(p)$ .  
7:   end if  
8: end for  
9: return  $N(p)$ .
```
